

PTD-1

**CURRENT PROBE TEST DEVICE**

The PRODYN PTD-1 is a device designed to test and calibrate the PRODYN I-300, I-310, and I-320 spring clamp-on type current probes. When probes are clamped over the conductor, current is driven through the probe from one connector and is terminated on the other with a matching impedance across bandwidth of generator used, thereby drawing full load current through the probe.
